

1

Homotopy theory

1.1 Review of basics on homotopy theory

We begin with a recollection of some facts that have been covered in Algebraic Topology I and Introduction to Topology.

1.1 Notation. We let $I = [0, 1]$ denote the unit interval. For a pointed topological space X we will denote the basepoint by x_0 or $*$.

We recall the following definition.

1.2 Definition. A homotopy between $f, g: X \rightarrow Y$ is a continuous function $H: X \times I \rightarrow Y$ such that $H(x, 0) = f(x)$ and $H(x, 1) = g(x)$ and $H(x_0, t) = y_0$ for all $t \in I$. We will write $f \simeq g$, or $f \simeq_H g$, if we need to make the choice of homotopy clear.

For a subspace $A \subseteq X$, a relative homotopy is a homotopy with $H(a, t) = f(a) = g(a)$ for all $a \in A, t \in I$.

1.3 Remark. Equivalently, we can specify a family of continuous maps $h_t: X \rightarrow Y$ such that $h_0 = f, h_1 = g$ and

$$\begin{aligned} H: X \times I &\rightarrow Y \\ (x, t) &\mapsto h_t(x) \end{aligned}$$

is continuous. We will switch between the two equivalent definitions without comment, using whatever is more convenient.

1.4 Proposition. For all spaces X and Y , homotopy is an equivalence relation on the set of maps from X to Y . Furthermore, if we are given $k: A \rightarrow X, \ell: Y \rightarrow B$ and homotopic maps $f \simeq g: X \rightarrow Y$, then $fk \simeq gk: A \rightarrow Y$ and $\ell f \simeq \ell g: X \rightarrow B$.

Proof. Let $f, g: X \rightarrow Y$, then

1. $f \simeq_F f$ via $F(x, t) = f(x)$ for all $x \in X, t \in I$.
2. If $f \simeq_F g$, then $g \simeq_G f$ where $G(x, t) = F(x, 1 - t)$.
3. If $f \simeq_F g$ and $g \simeq_G h$, then $f \simeq_H h$ via

$$H(x, t) = \begin{cases} F(x, 2t) & \text{if } 0 \leq t \leq 1/2 \\ G(x, 2t - 1) & \text{if } 1/2 \leq t \leq 1. \end{cases}$$

For the last part of the proposition let f_t be a homotopy between f and g , then $f_t k$ and ℓf_t give the required homotopy. \square

Figure 1.1: A homotopy between f and g .

1.5 Definition. For a map $f: X \rightarrow Y$, we let $[f]$ denote the equivalence class containing f . The collection of all homotopy classes of maps from X to Y is denoted $[X, Y]$.¹

¹ If our spaces are based, then these should be homotopy classes of *based* maps.

1.6 Remark. Note that if $\alpha = [f] \in [Y, Z]$ and $\beta = [g] \in [X, Y]$, then $\alpha\beta = [f \circ g] \in [X, Z]$, i.e., we can form the category $hTop_*$ whose objects are topological spaces, and whose morphisms are homotopy classes of maps.

1.7 Remark. We now very quickly review a number of standard topological constructions.

- Let X be a space and $A \subseteq X$. A map $r: X \rightarrow A$ such that $r(a) = a$ for all $a \in A$ is called a retraction of X onto A , and A is called a retract of X .
- Let $i: A \hookrightarrow X$ be the inclusion, so that $ri = \text{id}_A$. If $ir \simeq \text{id}_X$, we call this a deformation retraction, and say that A is a deformation retract of X .
- If $f: X \rightarrow Y$, then a section of f is a map $s: Y \rightarrow X$ such that $f \circ s = \text{id}_Y$. We can also ask for a *homotopy* section by requiring only that $f \circ s \simeq \text{id}_Y$.

1.8 Definition. A map $f: X \rightarrow Y$ is called null-homotopic if $f \simeq c_y: X \rightarrow Y$ where $c_y: X \rightarrow Y$ is the constant map sending all of X to the point $y \in Y$. A homotopy between f and c_y is called a null-homotopy. A space X is contractible if id_X is null-homotopic.

1.9 Definition. Let (X, x_0) be a based topological space and $X \times I$ the cylinder on X . The quotient

$$CX = (X \times I) / (X \times \{1\} \cup \{x_0\} \times I)$$

with the base-point the equivalence class of $(x_0, 1)$ is called the (reduced) cone on X . Note that we have a natural inclusion $X \rightarrow CX$ of based maps given by $x \mapsto [x, 0]$.

1.10 Lemma. The cone CX is contractible.

Proof. Define $F: CX \times I \rightarrow CX$ by

$$F([x, t], s) = [x, s + (1 - s)t].$$

Note then that we have

$$F([x, t], 0) = [x, t] \quad \text{and} \quad F([x, t], 1) = [x, 1]. \quad \square$$

1.11 Lemma. The following are equivalent:

- (i) $f: X \rightarrow Y$ is null-homotopic.
- (ii) f can be extended to CX :

$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ i \downarrow & \nearrow \exists \tilde{f} & \\ CX & & \end{array}$$

Proof. (i) \implies (ii) : Suppose f is null-homotopic, so $f \simeq_F *$.

Then $F(X \times \{1\} \cup \{*\} \times I) = *$, so by the universal property of the quotient, we can find $\tilde{F}: CX \rightarrow Y$ such that $\tilde{f} \circ i = f$.

(ii) \implies (i) : Suppose $\tilde{f} \circ i = f$, then because CX is contractible (Lemma 1.10), we have $f = \tilde{f} \circ \text{id}_{CX} \circ i \simeq \tilde{f} \circ (*_{CX}) \circ i \simeq *$, so that f is null-homotopic. \square

1.12 Definition. A map $f: X \rightarrow Y$ is a homotopy equivalence if there exists $g: Y \rightarrow X$ such that $fg \simeq \text{id}_Y$ and $gf \simeq \text{id}_X$. We write $X \simeq Y$.

1.13 Example. (i) X is contractible if and only if $X \simeq *$.

(ii) If $i: A \hookrightarrow X$, and $r: X \rightarrow A$ is a deformation retract, then i and r are homotopy equivalences, and $A \simeq X$.

1.2 Higher homotopy groups

1.14 Notation. We will let $I_n = I^{\times n}$, ∂I^n be the boundary of I^n , and write $[-, -]$ for homotopy classes of maps (if our spaces are based, these fix the base point).

1.15 Definition. For each $n \geq 0$ and X a topological space with $x_0 \in X$, we define

$$\pi_n(X, x_0) = [(I^n, \partial I^n), (X, x_0)].$$

1.16 Remark. (i) When $n = 0$, we have $I^0 = \text{pt}$ and $\partial I^0 = \emptyset$, therefore $\pi_0(X)$ is the set of path components of X .

(ii) When $n = 1$, this is a group, but need not be abelian (for example, consider the wedge of two circles).

(iii) Note that $I^n / \partial I^n \simeq S^n$ and $\partial I^n / \partial I^n \simeq s_0$. By the universal property of the quotient map, we see that

$$\pi_n(X, x_0) \cong [(S_n, s_0), (X, x_0)].$$

1.17 Definition. A map of pairs $(X, A) \rightarrow (Y, B)$ is a map $f: X \rightarrow Y$ with $f(A) \subseteq B$, i.e., the diagram:

$$\begin{array}{ccc} A & \longrightarrow & B \\ \downarrow & & \downarrow \\ X & \xrightarrow{f} & Y \end{array}$$

commutes.

1.18 Proposition. If $n \geq 1$, then $\pi_n(X, x_0)$ is a group with respect to the operation

$$(f + g)(t_1, \dots, t_n) = \begin{cases} f(2t_1, t_2, \dots, t_n) & 0 \leq t_1 \leq 1/2 \\ g(2t_1 - 1, t_2, \dots, t_n) & 1/2 \leq t_1 \leq 1. \end{cases}$$

Proof. The identity is given by the constant map taking all of I^n to x_0 and the inverse of f is given by

$$-f(t_1, \dots, t_n) = f(1 - t_1, t_2, \dots, t_n). \quad \square$$

1.19 Remark. Call the group operation $+_1$. Note that we can also define an operation $+_i$ for $1 \leq i \leq n$ by the same formula on the i -th coordinate.

1.20 Theorem. All of these operations agree, and for $n \geq 2$, these give $\pi_n(X, x_0)$ the structure of an abelian group.

This is a consequence of the following exercise, known as the Eckmann–Hilton lemma.

Exercise 1.2.1: Eckmann–Hilton lemma

Let M be a set and let $*$, \bullet be two binary operations on M , $*, \bullet: M \times M \rightarrow M$, both with unit elements. Suppose that

$$(a * b) \bullet (c * d) = (a \bullet c) * (b \bullet d)$$

for all $a, b, c, d \in M$. Show that the units agree, these two operations agree, and that the multiplication is commutative and associative.

1.21 Remark. Let us show that

$$(f +_1 g) +_2 (h +_1 i) \simeq (f +_2 h) +_1 (g +_2 i).$$

Indeed, both of these are the following map

$$(t_1, t_2, \dots) \mapsto \begin{cases} f(2t_1, 2t_2, \dots) & [1/2, 0] \times [1/2, 0] \\ g(2t_1 - 2, 2t_2, \dots) & [1/2, 1] \times [0, 1/2] \\ h(2t_1, 2t_2 - 2, \dots) & [0, 1/2] \times [1/2, 1] \\ i(2t_1 - 1, 2t_2 - 2, \dots) & [1/2, 1] \times [1/2, 1]. \end{cases}$$

1.22 Remark. Another approach is given by the following visualization: That is, so long as $n \geq 2$, we can shrink the domain of f and g

Figure 1.2: $f + g \simeq g + f$.

to smaller cubes (mapping the remaining region to the base point), slide f and g past each other, and then increase the domains back again.

Exercise 1.2.2

Let G be a topological group with identity element e , then $\pi_1(G, e)$ is abelian.

Hint: Use Eckmann–Hilton, or note the following: A topological group is a group object in the category of topological spaces. What is a group object in the category of groups?

1.23 Proposition. If $n \geq 1$ and X is path connected then there is an isomorphism $\beta_\gamma : \pi_n(X, x_0) \xrightarrow{\cong} \pi_n(X, x_0)$ given by $\beta_\gamma([f]) = [\gamma \circ f]$ where γ is a path in X from x_1 to x_0 and $\gamma \circ f$ is constructed by first shrinking the domain of f to a smaller cube inside of I^n , and then inserting the path γ radially from x_1 to x_0 on the boundaries of these cubes.

Figure 1.3: β_γ .

Proof. Observe the following:

1. $\gamma \circ (f + g) \simeq \gamma \circ f + \gamma \circ g$, i.e., β_γ is a group homomorphism.
2. $(\gamma \circ \eta) \circ f \simeq \gamma \circ (\eta \circ f)$, for η a path from x_0 to x_1 .
3. $c_{x_0} \circ f \simeq f$, where c_{x_0} denotes the constant path based at x_0 .
4. β_γ is well-defined with respect to homotopies of f or γ .

The only point that is perhaps not clear is (i). For this, we deform f and g to be constant on the right and left halves of I^n , respectively, producing maps we call $f + 0$ and $0 + g$. We then excise a wider symmetric middle slab of $\gamma(f + 0)$ and $\gamma(0 + g)$ until it becomes $\gamma(f + g)$: \square

1.24 Remark. Therefore if X is path-connected, different choices of base point x_0 yield isomorphic groups $\pi_n(X, x_0)$, which may then simply be written as $\pi_n(X)$.

1.25 Lemma. If $\{X_\alpha\}$ is a collection of path-connected spaces, then $\pi_n(\prod_\alpha X_\alpha) \cong \prod_\alpha \pi_n(X_\alpha)$.

Proof. Note that $\text{Hom}(Y, \prod_\alpha X_\alpha) \simeq \prod_\alpha \text{Hom}(Y, X_\alpha)$. In particular, a map $S^n \rightarrow \prod_\alpha X_\alpha$ is determined by a collection of maps $S^n \rightarrow X_\alpha$. Likewise, a homotopy $S^n \times I \rightarrow \prod_\alpha X_\alpha$ is determined by a collection of homotopies $S^n \times I \rightarrow X_\alpha$. This implies the result. \square

1.26 Proposition. Homotopy groups are functorial: given a map $\phi : X \rightarrow Y$ we get group homomorphisms $\phi_* : \pi_n(X, x_0) \rightarrow \pi_n(Y, \phi(x_0))$ given by $[f] \mapsto [\phi \circ f]$ for all $n \geq 1$.

Proof. We have the following:

1. ϕ_* is well-defined: if $f \simeq g$ via ψ_t , then $\phi \circ \psi_t$ defines a homotopy between $\phi \circ f$ and $\phi \circ g$.
2. This is a group homomorphism: $\phi \circ (f + g) \simeq \phi \circ g + \phi \circ f$ by the definition of the addition operation. Therefore.

$$\phi_*[f + g] = \phi_*[f] + \phi_*[g].$$

Exercise 1.2.3

If $\phi: X \rightarrow Y$ is homotopy equivalence (not necessarily base-point preserving), then $\pi_*: \pi_n(X, x_0) \rightarrow \pi_n(Y, \phi(y_0))$ is an isomorphism.

□

1.27 Remark. We recall the following lifting property: Suppose $p: (\tilde{X}, \tilde{x}_0) \rightarrow (X, x_0)$ is a covering, and there is a map $f: (Y, y_0) \rightarrow (X, x_0)$ with Y path-connected and locally path-connected. Then a lift \tilde{f} exists if and only if $f_*\pi_1(Y, y_0) \subseteq p_*\pi_1(\tilde{X}, \tilde{x}_0)$.

$$\begin{array}{ccc} & (\tilde{X}, \tilde{x}_0) & \\ \tilde{f} \nearrow & \downarrow p & \\ (Y, y_0) & \xrightarrow{f} & (X, x_0) \end{array}$$

1.28 Proposition. If p is a covering, then $p_*: \pi_n(\tilde{X}, \tilde{x}_0) \rightarrow \pi_n(X, x_0)$ is an isomorphism for all $n \geq 2$.

Proof. Let us first show surjectivity. To that end, suppose we have a map $f: (S^n, s_0) \rightarrow (X, x_0)$ where $n \geq 2$. The assumption on n gives $\pi_1(S^n) = 0$, so $f_*\pi_1(S^n, s_0) \subseteq p_*\pi_1(\tilde{X}, \tilde{x}_0)$ holds. We therefore find a lift in the following:

$$\begin{array}{ccc} & (\tilde{X}, \tilde{x}_0) & \\ \tilde{f} \nearrow & \downarrow p & \\ (S^n, s_0) & \xrightarrow{f} & (X, x_0) \end{array}$$

Then $p_*[\tilde{f}] = [f]$, and p_* is surjective.

To see that p_* is injective, let $[\tilde{f}] \in \ker(p_*)$, i.e., $p_*[\tilde{f}] = [p \circ \tilde{f}] = 0$. Let $f = p \circ \tilde{f}$, then this is homotopic to the constant map $f \simeq c_{x_0}$ via a homotopy $\phi_t: (S^n, s_0) \rightarrow (X, x_0)$ with $\phi_1 = f$ and $\phi_0 = c_{x_0}$. By the same argument as above, the homotopy ϕ_t can be lifted to $\tilde{\phi}_t$. This satisfies $p \circ \tilde{\phi}_1 \simeq \phi_1$ and $p \circ \tilde{\phi}_0 \simeq \phi_0$. By the uniqueness of lifts, we must have $\tilde{\phi}_1 \simeq \tilde{f}$ and $\tilde{\phi}_0 \simeq c_{\tilde{x}_0}$. In other words, $\tilde{\phi}_t$ gives a homotopy between \tilde{f} and $c_{\tilde{x}_0}$, so that $[\tilde{f}] = 0$, and p_* is injective. □

1.29 Example. S^1 has universal cover $p: \mathbb{R} \rightarrow S^1$, $p(t) = e^{2\pi it}$. Then $\pi_n(S^1) \cong \pi_n(\mathbb{R}) \cong 0$ for $n \geq 2$.

Exercise 1.2.4

Find two spaces X, Y with $\pi_n X \cong \pi_n Y$ but $X \not\simeq Y$.

Hint: What is the universal cover of $\mathbb{R}P^n$?

1.30 Remark (Relative homotopy groups). Suppose we have (X, x_0) and a subspace A containing x_0 . We note that $i_*: \pi_n(A, x_0) \rightarrow \pi_n(X, x_0)$ is not injective in general (example, take S^1 into \mathbb{R}^2). An element in the kernel of i_* is a map $f: (I^n, \partial I^n) \rightarrow (A, x_0)$ such that

$$(I^n, \partial I^n) \xrightarrow{f} (A, x_0) \xrightarrow{i} (X, x_0)$$

is homotopic to c_{x_0} . This means there exists a homotopy

$$H: I^n \times I \rightarrow X$$

such that $H(-, 1) = f$, $H(-, 0) = c_{x_0}$ and $H|_{\partial I^n \times I} = c_{x_0}$.

If we define $J^n = I^n \times \{0\} \cup \partial I^n \times I \subseteq I^n \times I$, then this is a map of triples

$$H: (I^{n+1}, \partial I^{n+1}, J^n) \rightarrow (X, A, x_0).$$

1.31 Definition.

$$\pi_n(X, A, x_0) = [(I^n, \partial I^n, J^{n-1}), (X, A, x_0)]$$

1.32 Remark. Equivalently,

$$\pi_n(X, A, x_0) = [(D^n, S^{n-1}, s_0), (X, A, x_0)]$$

1.33 Proposition. If $n \geq 2$, then $\pi_n(X, A, x_0)$ is a group, and if $n \geq 3$, then it is abelian.

For all $n \geq 2$, a map of pairs $\phi: (X, A, x_0) \rightarrow (Y, B, y_0)$ induces homomorphisms $\phi_*: \pi_n(X, A, x_0) \rightarrow \pi_n(Y, B, y_0)$ for all $n \geq 2$.

1.34 Theorem. The relative homotopy groups (X, A, x_0) fit into a long exact sequence

$$\cdots \rightarrow \pi_n(A, x_0) \xrightarrow{i_*} \pi_n(X, x_0) \xrightarrow{j_*} \pi_n(X, A, x_0) \xrightarrow{\partial_n} \pi_{n-1}(A, x_0) \rightarrow \cdots$$

where the map ∂_n is defined by $\partial_n([f]) = [f|_{I^{n-1}}]$.

The proof relies on the following.

1.35 Lemma (Compression criterion). A map $f: (D^n, S^{n-1}, x_0) \rightarrow (X, A, x_0)$ represents 0 in $\pi_n(X, A, x_0)$ if and only if $f \sim g \text{ rel } S^{n-1}$, where g is a map whose image is contained entirely in A .

Proof. Suppose $[f] = [g]$ with g as in the statement of the lemma. Note that there is a deformation of D^n onto x_0 , and so $[f] = [g] = 0$ in $\pi_n(X, A, x_0)$.

Conversely, suppose that $[f]$ represents 0 in $\pi_n(X, A, x_0)$. This means there exists a homotopy, relative to S^{n-1} , $F: D^n \times I \rightarrow X$ with $F|_{D^n \times \{0\}} = f$, $F|_{D^n \times \{1\}} = c_{x_0}$ and $F|_{S^{n-1} \times I} \subseteq A$. We can restrict F to a family of n -disks in $D^n \times I$ starting with $D^n \times \{0\}$ and ending with the disk $D^n \times \{1\} \cup S^{n-1} \times \{1\}$, all the disks in the family having the same boundary, then we get a homotopy from f to a map in A , stationary on S^{n-1} (said in other words, we can deformation retract $D^n \times [0, 1]$ onto $D^n \times \{1\} \cup S^{n-1} \times I$). \square

Proof of Theorem 1.34. **Step 1.** Let us first show exactness at $\pi_n(X, x_0)$.

We first show $\text{im}(i_*) \subseteq \ker(j_*)$. Note that j_*i_* is induced by the composition $j \circ i$ and that these are both inclusion maps. Therefore, for $[f] \in \pi_n(A, x_0)$ we have $j_*i_*[f] = [j \circ i \circ f]$, but this has image contained in A , and so $j_*i_*[f] = 0$. This shows $\text{im}(i_*) \subseteq \ker(j_*)$.

To see the converse (namely, $\ker(j_*) \subseteq \text{im}(i_*)$) let $[f] \in \ker(j_*)$, i.e. $[j \circ f] = 0$. Note that again j is an inclusion map, and by the compression criteria $f \simeq g'$ relative to S^{n-1} , where g' has image contained in A . Since $x_0 \in S^{n-1}$, the homotopy fixes the basepoint, i.e. $[f] = [g'] \in \pi_n(X, x_0)$. But because g' has image in A , $[g'] \in \pi_n(A, x_0)$ and $i_*[g'] = [i \circ g'] = [f]$, so $[f] \in \text{im}(i_*)$.

Step 2. Let us now show exactness at $\pi_n(X, A, x_0)$.

Note that the composite $\partial \circ j_* = 0$ since the restriction of a map $(I^n, \partial I^n, J^{n-1}) \rightarrow (X, x_0, x_0)$ to I^{n-1} has image x_0 and so represents 0 in $\pi_{n-1}(A, x_0)$. Therefore, $\text{im}(j_*) \subseteq \ker(\partial)$. For the converse, suppose $[f] \in \ker(\partial)$. This means there exists a basepoint preserving homotopy $H: I^{n-1} \times I \rightarrow A$ (relative to ∂I^{n-1}) from $f|_{I^{n-1} \times \{0\}}$ to the constant map where the image of H is contained entirely in A . We can then define another homotopy G , such that $G_0 = f$, $G_t|_{I^{n-1}} = H_t$ and the rest of the image of G_t is $f[I^n]$ union with the image of H_s for $0 \leq s \leq t$. This homotopy maps S^{n-1} into A at all times, so $[f] = [G_1]$. Moreover, G_1 maps the boundary of I^n to x_0 , so $[G_1] \in \pi_n(X, x_0)$. Altogether,

$$j_*[G_1] = [j \circ G_1] = [G_1] = [f]$$

so $\ker(\partial) \subseteq \text{im}(j_*)$.

Step 3: Exactness at $\pi_n(A, x_0)$.

Let $[f] \in \pi_n(X, A, x_0)$ then $i_*\partial \in \pi_{n-1}(X, x_0)$ is the class represented by $f|_{I^{n-1}}$ and this is homotopic relative J^{n-2} to the constant map to x_0 , via f viewed as a homotopy. So this implies $\text{im}(\partial_*) \subseteq \ker(i_*)$. Conversely, let $[f] \in \ker(i_*)$ i.e., $i_*[f] = [i \circ f] = 0$. Therefore, there exists a homotopy H between f and a constant map through a homotopy that has image in X and preserves x_0 . Since $H_0 = f$ has image in A and H_1 has image $\{x_0\}$, and H_0 takes the boundary to $\{x_0\}$, we see that $[H] \in \pi_n(X, A, x_0)$, and moreover $\partial([H]) \simeq f$. Therefore, $[f] \in \text{im}(\partial)$, and $\text{im}(\partial) = \ker(i_*)$. \square

1.36 Definition. A pair (X, A) with basepoint x_0 is said to be n -connected if $\pi_i(X, A) = 0$ for all $i \leq n$.

1.37 Lemma. A pair (X, A) is n -connected if and only if $\pi_i(A) \xrightarrow{i_*} \pi_i(X)$ is an isomorphism for $i < n$ and a surjection for $i = n$.

Proof. Use the long exact sequence in homotopy. \square

Exercise 1.2.5

Let X be a path-connected space, and CX the cone on X . Show that

$$\pi_n(CX, X, X_0) \cong \pi_{n-1}(X, x_0)$$

for $n \geq 1$.
